

STANDARD COLUMN COVER

Installation Instructions:

1. Establish plumb lines as guides for column cover placement. Put a bead of construction adhesive on the bottom of the lower flange and stand the column into position using shims at the floor if required.
2. Anchor the lower flange to the floor. Backing material may be needed to help prevent the anchors from penetrating the flange. Secure the upper flange to the existing structure using metal angles and drywall screws. Use a backing material to avoid stripping.
3. Run beads of adhesive on the bottom of the lower flange and both side flanges of the second column half. Place the second half against the first and band them together firmly.
4. Space several bands along the cover to insure uniform pressure. After allowing sufficient time for adhesive to dry completely, remove the bands and float the column joints together using typical drywall methods.
